

Intelligent Lighting Control

Embedded Automation & Cloud Application

Overview

With the rapid development of information technology, some of the actions that had to be made by human actions can be made by the technology, the light control is one of them.

Through the system to control the lighting can not only save electricity to achieve the purpose of energy conservation, but also create a variety of situations through a series of operation settings.

Architecture

Using intelligent light control system. Situational control can be done with reliable control function, and can remote control lighting equipment. If an abnormal condition occurred, the system will issue a warning notice.

Adoption : EBox-AIO Series

Abnormal Warning

Confirm the operation at the first time

Smooth Information

Real-time information easy to manage

Intelligent Control

Situation setting and Period control

Remote Monitoring

Cloud and Mobile device management
